You will not be charged until after you review and complete your order. #1 Veterinarian recommended Maintains healthy joint Protects against arthritis Increase joint mobility and function The item is a sprinkle capsule, The capsule can be just sprinkled on the dog's food. Product Description As dogs age, it is common for their joints to become less flexible which impacts their mobility and quality of life. You may have noticed that your dog has difficulty walking up stairs or jumping on the bed. While he used to be eager to play, now he is content to rest. Even at younger ages some dogs are subject to joint health concerns which affect flexibility and mobility. Recommendation as a Supplement: The Initial Administration Period is 6 Weeks. Most animals should respond within this period. Improvement on Cosequin can range from gradual to dramatic. If the improvement is gradual, it may go unnoticed by the owner. It is therefore important to keep the animal at the initial amount for at least 6 weeks before deciding to discontinue the use of Cosequin. If there is gradual improvement and Cosequin is discontinued, a regression of clinical status can occur. Directions: Initial Administration (6 Weeks) Dogs: 25-49 lb. - 2 capsules daily (1 in A.M./ 1 in P.M.), 50-100 lb. - 3 capsules daily (2 in A.M./ 1 in P.M.), Over 100 lb. - 4 capsules daily (2 in A.M./ 2 in P.M.) Cosequin DS double strength can be used on patients under 25 lb., however, 1/2 capsule increments must be used. For convenience, Cosequin regular strength should be used. Regular strength can also be used for maintenance of dogs weighing 25-49 lb. that maintain below one capsule daily of double strength. The capsules can be pulled apart and the contents sprinkled on the pet's food. Wet or moist food works best. As an alternative, pets can be pillled or the capsules administered by wrapping in a small piece of food.
